EECS730: Introduction to Bioinformatics

Lecture 07: profile Hidden Markov Model

http://bibiserv.techfak.uni-bielefeld.de/sadr2/databasesearch/hmmer/profileHMM.gif

Slides adapted from Dr. Shaojie Zhang (University of Central Florida)

Information from multiple sequence alignments

- Protein/Gene family: homolog, ortholog, paralog, and xenolog
- Usually homologs are rooted form the same gene, diverged during evolution, and have similar biological functions
- Multiple alignments of homologous sequences usually reveal important sequence feature of the protein family and indicate its function
- We have discussed in the previous class how to build multiple sequence alignments from a set of homologous sequences

The revised homolog detection problem

The revised homolog detection problem

- Input: a set of homologous sequences from the same protein family, and a unannotated protein sequence
- Output: the likelihood that the unannotated protein sequence is also from the protein family
- Naïve solution: perform pairwise alignment between each sequence in the family with the unannotated protein sequence
- It could be very slow, and it may not reflect true homology

Can we summarize information of a protein family from MSA?

An intuitive way is to summarize column-wise frequency

GAGGTAAAC TCCGTAAGT CAGGTTGGA ACAGTCAGT TAGGTCATT TAGGTACTG ATGGTAACT CAGGTATAC TGTGTGAGT AAGGTAAGT

$$M_{k,j} = \frac{1}{N} \sum_{i=1}^{N} I(X_{i,j} = k),$$

$$M = \frac{A}{C} \begin{bmatrix} 3 & 6 & 1 & 0 & 0 & 6 & 7 & 2 & 1 \\ 2 & 2 & 1 & 0 & 0 & 2 & 1 & 1 & 2 \\ 1 & 1 & 7 & 10 & 0 & 1 & 1 & 5 & 1 \\ 4 & 1 & 1 & 0 & 10 & 1 & 1 & 2 & 6 \end{bmatrix}$$

$$M = \frac{A}{C} \begin{bmatrix} 0.3 & 0.6 & 0.1 & 0.0 & 0.0 & 0.6 & 0.7 & 0.2 & 0.1 \\ 0.2 & 0.2 & 0.1 & 0.0 & 0.0 & 0.2 & 0.1 & 0.1 & 0.2 \\ 0.1 & 0.1 & 0.7 & 1.0 & 0.0 & 0.1 & 0.1 & 0.5 & 0.1 \\ 0.4 & 0.1 & 0.1 & 0.0 & 1.0 & 0.1 & 0.1 & 0.2 & 0.6 \end{bmatrix}$$

https://en.wikipedia.org/wiki/Position_weight_matrix

Using the Position Specific Scoring Matrix

- Modified matching scores
 - Sum(p_{i,j} * score(j, a))

https://upload.wikimedia.org/wikipedia/commons/8/ 85/LexA gram positive bacteria sequence logo.png

- Keep the original setup for the gap penalty
- RPS-BLAST
- The gaps are not handled well, we need more advanced model to account for gaps

Introducing the Markov Model

• First-order Markov Chain

M = (Q, π, a)

Q – finite set of states, say |Q| = na – n x n transition probability matrix a(i,j)= Pr[q_{t+1}=j|g_t=i] π – n-vector, starting probability vector π (i) = Pr[q₀=i] For any row of a the sum of entries = 1 $\Sigma\pi$ (i) = 1

Hidden Markov Model (HMM)

Hidden Markov Model is a Markov model in which one does not observe a sequence of states but results of a function prescribed on states – in our case this is emission of a symbol (amino acid or a nucleotide).

States are hidden to the observers.

Emission probabilities

- Assume that at each state a Markov process emits (with some distribution) a symbol from alphabet Σ .
- Rather than observing a sequence of states we observe a sequence of emitted symbols.

Example: $\Sigma = \{A,C,T,G\}$. Generate a sequence where A,C,T,G have frequency p(A) =.33, p(G)=.2, p(C)=.2, p(T) = .27 respectively

HMM

- HMM is a Markov process that at each time step generates a symbol from some alphabet, Σ , according to emission probability that depends on state. M = (Q, Σ , π , a, e)
- Q finite set of states, say n states ={ $q_0, q_1, ...$ }
- a n x n transition probability matrix: $a(i,j) = Pr[q_{t+1}=j|g_t=i]$
- π n-vector, start probability vector: π (i) = Pr[q₀=i]
- $\Sigma = \{\sigma_1, ..., \sigma_k\}$ -alphabet
- $e(i,j) = Pr[o_t = \sigma_i | q_t = i]; o_t t^{th}$ element of generated sequences
- = probability of generating o_i in state q_i (S= o_0 ,... o_T the output sequence)

Occasionally dishonest casino

Summarizing MSA using HMM

If we simply consider MSA columns without gaps This is equivalent to PSSM

MSA to HMM

• Considering the Insertions

$$\log a_{\mathbf{M}_j\mathbf{I}_j} + \log a_{\mathbf{I}_j\mathbf{M}_{j+1}} + (k-1)\log a_{\mathbf{I}_j\mathbf{I}_j}.$$

MSA to HMM

Affine gap penalty

MSA to HMM, the complete model

How many states should we have

- The number of matching state is usually determined as the number of columns who have non-gap majority
- Number of insertion and deletion states determined correspondingly

Computing the parameters

Emission probability

$$e_k(a) = \frac{E_k(a)}{\sum_{a'} E_k(a')}$$

• Transition probability

$$a_{kl} = \frac{A_{kl}}{\sum_{l'} A_{kl'}}$$

HBA_HUMAN ...VGA--HAGEY... HBB_HUMAN ...V.---NVDEV... MYG_PHYCA ...VEA--DVAGH... GLB3_CHITP ...VKG----D... GLB5_PETMA ...VYS--TYETS... LGB2_LUPLU ...FNA--NIPKH... GLB1_GLYDI ... IAGADNGAGV... * * * * * * * *

How to align MSA profile to a sequence

$$V_{j}^{M}(i) = \log \frac{e_{M_{j}}(x_{i})}{q_{x_{i}}} + \max \begin{cases} V_{j-1}^{M}(i-1) + \log a_{M_{j-1}M_{j}}, \\ V_{j-1}^{I}(i-1) + \log a_{L_{j-1}M_{j}}, \\ V_{j-1}^{D}(i-1) + \log a_{D_{j-1}M_{j}}; \end{cases}$$
$$V_{j}^{I}(i) = \log \frac{e_{1j}(x_{i})}{q_{x_{i}}} + \max \begin{cases} V_{j}^{M}(i-1) + \log a_{M_{j}L_{j}}, \\ V_{j}^{I}(i-1) + \log a_{L_{j}L_{j}}, \\ V_{j}^{D}(i-1) + \log a_{D_{j}L_{j}}; \end{cases}$$
$$V_{j}^{D}(i) = \max \begin{cases} V_{j-1}^{M}(i) + \log a_{M_{j-1}D_{j}}, \\ V_{j-1}^{I}(i) + \log a_{L_{j-1}D_{j}}, \\ V_{j-1}^{D}(i) + \log a_{D_{j-1}D_{j}}. \end{cases}$$

Time complexity

• O(MN), where M is the number of states in HMM and N is the length of the observed sequence

Viterbi algorithm for generalized HMM

Algorithm: Viterbi

Initialisation (i = 0): $v_0(0) = 1, v_k(0) = 0$ for k > 0.

Recursion
$$(i = 1 \dots L)$$
: $v_l(i) = e_l(x_i) \max_k (v_k(i-1)a_{kl});$
 $\operatorname{ptr}_i(l) = \operatorname{argmax}_k (v_k(i-1)a_{kl}).$

Termination:
$$P(x,\pi^*) = \max_k(v_k(L)a_{k0});$$
$$\pi_L^* = \operatorname{argmax}_k(v_k(L)a_{k0}).$$

Traceback (i = L ... 1): $\pi_{i-1}^* = ptr_i(\pi_i^*)$.

Time complexity

 O(M²N), where M is the number of states in HMM and N is the length of the observed sequence

Limitation of the Viterbi path

Forward-backward algorithm

- Using Viterbi algorithm, we can calculate the most probable parse of the observed sequence given the HMM
- However, in many cases we want to calculate all probable parses that can give rise to the observed sequence given the HMM
- This can be very useful when there are many suboptimal paths that are nearly as good as the most probable path
- We can compute is using the Forward algorithm

Forward algorithm

$$f_k(i) = P(x_1 \dots x_i, \pi_i = k),$$

Algorithm: Forward algorithm

Initialisation (i = 0): $f_0(0) = 1$, $f_k(0) = 0$ for k > 0. Recursion $(i = 1 \dots L)$: $f_l(i) = e_l(x_i) \sum_k f_k(i-1)a_{kl}$. Termination: $P(x) = \sum_k f_k(L)a_{k0}$.

The need for decoding

What is the probability that an observed character comes from a given state???

$$P(x, \pi_i = k) = P(x_1 \dots x_i, \pi_i = k) P(x_{i+1} \dots x_L | x_1 \dots x_i, \pi_i = k)$$

= $P(x_1 \dots x_i, \pi_i = k) P(x_{i+1} \dots x_L | \pi_i = k),$

$$f_k(i) = P(x_1 \dots x_i, \pi_i = k),$$

$$b_k(i) = P(x_{i+1} \dots x_L | \pi_i = k).$$

Backward algorithm

Algorithm: Backward algorithm Initialisation (i = L): $b_k(L) = a_{k0}$ for all k.

Recursion
$$(i = L - 1, ..., 1)$$
: $b_k(i) = \sum_l a_{kl} e_l(x_{i+1}) b_l(i+1)$.
Termination: $P(x) = \sum_l a_{0l} e_l(x_1) b_l(1)$.

Decoding

$$P(\pi_i = k | x) = \frac{f_k(i)b_k(i)}{P(x)},$$

where P(x) is the result of the forward (or backward) calculation.

PFAM

HOME | SEARCH | BROWSE | FTP | HELP | ABOUT

Pfam 30.0 (June 2016, 16306 entries)

The Pfam database is a large collection of protein families, each represented by **multiple sequence alignments** and **hidden Markov models (HMMs)**. <u>More...</u>

QUICK LINKS	YOU CAN FIND DATA IN PFAM IN VARIOUS WAYS
SEQUENCE SEARCH	Analyze your protein sequence for Pfam matches
VIEW A PFAM ENTRY	View Pfam annotation and alignments
VIEW A CLAN	See groups of related entries
VIEW A SEQUENCE	Look at the domain organisation of a protein sequence
VIEW A STRUCTURE	Find the domains on a PDB structure
KEYWORD SEARCH	Query Pfam by keywords
JUMP TO	enter any accession or ID Go Example
	Enter any type of accession or ID to jump to the page for a Pfam entry or clan, UniProt sequence, PDB structure, etc.

Or view the help pages for more information
